

Risk Matrix

Scale: Likelihood and Impact rated Low / Medium / High. Severity = the combination, used to order mitigation priority (High×High is worked first).

Task 2 scenario — mobile trading app, pre-launch

#	RISK	LIKELIHOOD	IMPACT	SEVERITY	MITIGATION
1	Duplicate order/withdrawal from double-tap, retry, or app-kill mid-request (non-idempotent backend)	High	High	Critical	Idempotency keys on every money-movement call; explicit automated tests for double-submit and kill-mid-request; UI disables the action button on first tap.
2	Displayed balance drifts from the backend ledger under concurrency	Medium	High	Critical	Ledger reconciliation job + alerting; API contract tests asserting balance consistency after each operation; treat any drift as a Sev1.
3	No rollback/kill-switch if a money-bug ships	Medium	High	High	Feature-flag gate on trading/withdrawals before launch; rehearse a rollback once pre-launch.
4	iOS/Android divergence on auth/session security (biometrics, secure storage)	Medium	High	High	Explicit per-platform test pass on auth flows; never assume parity from one platform's result.
5	Price slippage between trade confirmation and execution shown as success	Medium	Medium	Medium	Explicit slippage-tolerance UX with clear error state; test the "price moved" path deliberately.
6	Session expiry mid-trade corrupts or silently drops the in-flight order	Medium	High	High	Test expired-token-mid-request explicitly; ensure the client re-auths without resubmitting a stale order.
7	KYC/AML or data-residency non-compliance in a launch region	Low	High	High	Legal sign-off gated into the release checklist before regional rollout; not a QA-only decision.
8	Network loss mid-transaction leaves the user unsure whether it succeeded	High	Medium	High	Deterministic post-reconnect state check (poll/query actual order status) rather than trusting the last local UI state.
9	No existing test suite means untested code paths ship silently	High	Medium	High	Risk-based triage (this matrix) drives day-1 manual coverage on the highest-severity rows first, before any automation exists for them.
10	Crash or performance issue only surfaces after public release (no monitoring)	Medium	Medium	Medium	Crash reporting + dashboards live before launch, actively watched for the first 48 hours.

Task 1 — trade.mb.io automation suite (secondary, operational risk)

#	RISK	LIKELIHOOD	IMPACT	SEVERITY	MITIGATION
A	Target app adds/strengthens auth gating on more public routes	Medium	Medium	Medium	Suite already scoped to what's verifiably public today; <code>test.fixme</code> entries make future re-enablement a one-line change once/if routes reopen.
B	Live market data (prices, row counts) is inherently volatile	High	Low	Low	Assertions target structure and presence (row count > 0, price matches a currency pattern), never specific live values.
C	Third-party analytics/ad network calls made during page load add noise/flakiness	Low	Low	Low	Assertions and route interception scoped to same-origin/first-party endpoints only (<code>core-api.mb.io</code> , <code>/api/mbio-coins</code>).

#	RISK	LIKELIHOOD	IMPACT	SEVERITY	MITIGATION
D	CSS-module class names are regenerated on every deploy	High	Medium	Medium	Locators use ARIA roles, visible text, and stable app-assigned ids/attributes (<code>data-index</code> , <code>#trade-header-option-open-button</code>) instead of hashed classes.
E	Suite is a guest on someone else's production infrastructure - heavy local parallelism (many workers x browsers hitting trade.mb.io at once) can itself induce transient hiccups (observed once: a Trade-menu link briefly rendered with an empty <code>href</code> under a <code>--repeat-each=2</code> full-matrix run; 10/10 clean in isolation)	Medium	Low	Low	<code>retries: 2</code> in CI (<code>playwright.config.ts</code>) absorbs genuine transient noise; the affected assertion also waits for a non-empty href before comparing, rather than asserting instantly. Not a defect in the app or the test logic - a reminder that "the target is a live shared system" is itself a standing constraint on how hard this suite should hammer it.
